INTRODUCTION¹

METHODS

SAMPLE

The NCS is based on a stratified, multi-stage area probability sample of persons aged 15 to 54 years in the noninstitutionalized civilian population in the 48 coterminous states. The inclusion of respondents as young as 15 years, compared with the 18-year-old lower age limit found in most general population surveys, was based on an interest in minimizing recall bias of early-onset disorders. The exclusion of respondents aged older than 54 years was based on evidence from the ECA Study that active comorbidity between substance use disorders and nonsubstance psychiatric disorders is much lower among persons older than 54 years than among those aged 54 years and younger. The NCS also includes a supplemental sample of students living in campus group housing. The survey was administered by the staff of the Survey Research Center at the University of Michigan (UM), Ann Arbor, between September 14, 1990 and February 6, 1992. The response rate was 82.6%. Cooperation in listed households did not differ markedly by age or sex, the only two listing variables available for all selected respondents. A total of 8098 respondents participated in the survey. Based on previous evidence that survey nonrespondents have higher rates of psychiatric disorder than respondents,^{2,3} a supplemental nonresponse survey was carried out in parallel with the main survey. In this supplemental survey, a random sample of initial nonrespondents was offered a financial incentive to complete a short form of the diagnostic interview. Elevated rates of both lifetime and current psychiatric disorders were found among these initial nonrespondents. A nonresponse adjustment weight was constructed for the main survey data to compensate for this systematic nonresponse. A second weight was used to adjust for variation in probabilities of selection both within and between households. A third weight was used to adjust the data to approximate the national population distributions of the cross-classification of age, sex, race/ethnicity, marital status, education, living arrangements, region, and urbanicity as defined by the 1989 U.S. National Health Interview Survey.⁴

DIAGNOSTIC ASSESSMENT

The psychiatric diagnoses reported below are based on the DSM-III-R.⁶ The diagnostic interview used to generate these diagnoses is a modified version of the Composite International Diagnostic Interview (CIDI),⁵ a state-of-the-art structured diagnostic interview based on the DIS and designed to be used by trained interviewers who are not clinicians.⁶ We deleted diagnoses known to have low prevalence in population-based surveys such as somatization disorder. We also deleted the Folstein-McHugh Mini-Mental State Examination, which is included in the full CIDI, based on pilot test results showing that respondents in the 15- to 54-year-old age range only rarely have high error scores and that those with high error scores in this age range disproportionately come from the foreign born and the poorly educated population groups. Our modifications of the remaining sections of the CIDI included adding commitment and motivation probes for recall of lifetime episodes, and including clarifying probes for CIDI questions found in pilot work to be unclear or confusing to respondents.

The *DSM-III-R* diagnoses included in the core NCS include major depression, mania, dysthymia, panic disorder, agoraphobia, social phobia, simple phobia, generalized anxiety disorder, alcohol abuse, alcohol dependence, drug abuse, drug dependence, antisocial personality disorder (ASPD), and nonaffective psychosis (NAP). Twelve-month diagnoses of substance use disorders were made in the subsample of respondents who qualified for the lifetime diagnosis and who reported at least one *DSM-III-R* symptom in the 12 months prior to the interview. Nonaffective psychosis is a summary category made up of schizophrenia, schizophreniform disorder, schizoaffective disorder, delusional disorder, and atypical psychosis. We also constructed a summary category for 12-month "severe" disorder, defined as (1) 12-month mania or NAP, (2) lifetime mania or NAP with 12-month treatment or role impairment, or (3) 12-month depression or panic disorder with severe impairment (hospitalization or use of antipsychotic medication).

World Health Organization field trials of the CIDI have documented good interrater reliability,^{7,8} test-retest reliability,^{9,10} and validity of almost all diagnoses.^{11,12,13,14,15,16,17} The exception is acute psychotic

disorder, which has been shown to be diagnosed with low reliability and validity in structured interviews like the CIDI.^{18,19} Based on this evidence, the NCS included clinical reinterviews with respondents who reported any evidence of psychotic symptoms. These reinterviews were administered by experienced clinicians using an adapted version of the Structured Clinical Interview for *DSM-III-R* (SCID),²⁰ an instrument with demonstrated reliability in the diagnosis of schizophrenia.²¹ The NCS diagnoses of schizophrenia and other nonaffective psychotic disorders (NAPs) are based on these clinical reinterviews rather than on the UM-CIDI interviews.

INTERVIEWERS AND INTERVIEWER TRAINING

As noted above, the NCS was carried out by the field staff of the Survey Research Center at the UM. The 158 interviewers who participated in the NCS had an average of 5 years of prior interviewing experience with the Survey Research Center. In addition, the NCS interviewers went through a 7-day study-specific training program in the use of the UM-CIDI. Fieldwork was closely monitored throughout the entire data collection period. Three field quality control procedures are worth noting. First, completed interviews were edited by one of 18 regional supervisors before they were returned to the national field office. This allowed rapid detection of missing data and unclear responses.

Incomplete interviews were returned to the interviewer, who recontacted the respondent to obtain the missing information. Second, a random sample of respondents was recontacted by the field supervisors to verify the accuracy of interviewer performance. Third, the field edits were checked at the national field office as soon as interviews were received. This provided a second check on interviewer performance as well as a check on the accuracy of the supervisor's editing. Supervisors were contacted whenever errors were found, and the interview was sent back to the field for resolution.

ANALYSIS PROCEDURES

As a result of the complex sample design and weighting, special software was required to estimate standard errors. Standard errors of proportions were estimated using the Taylor series linearization method.²² The PSRATIO program in the OSIRIS software package²³ was used to make these calculations. Standard errors of odds-ratios (ORs) were estimated by using the method of Balanced Repeated Replication in 44 design-based balanced subsamples.^{24,25} The LOGISTIC program in the SAS software package²⁶ was used to make these calculations.

ICPSR PROCESSOR NOTES

*** IMPORTANT SAMPLING WEIGHT INFORMATION ***

The ICPSR release of this study is broken into two files:

- 1) The main data file contains data from Part 1: the Diagnostic Interview (n=8098); Part 2: the Risk Assessment Interview (n=5877) and tobacco use supplement (n=4414).
- 2) The diagnosis/demographic data file contains recoded and derived diagnosis variables and demographic categories (DXDM), based on survey response items from the main data file.

WEIGHTING

Due to differences in the probabilities of selection, four different weights are used with the NCS data. In order to appropriately weight the data, use Tables A-C below and the following rules:

1. If at least one variable used is from Table C:
 - a. If another variable is from Table B, then use P2tobwt.
 - b. Otherwise use tobacwt.
2. If at least one variable is used from Table B and none are from Table C, use P2wtv3.
3. If all variables used are from Table A, use P1fwt.

V1205

d47:feeling w/problems

REF=1205 ID=DDE

D47. (RB, STILL ON P. 3) You said you had a period in your life when you felt (KEY PHRASE ONE) and also said you have had the other problems you just circled. Has there ever been a time when the period(s) of feeling (KEY PHRASE ONE) and some of these other problems circled on Page 3 occurred together--that is, within the same month?

SECTION G: MEDICATIONS & DRUGS-PART I

V1817

g1:sedative on your own REF=1817 ID=DDE

G0. (RB, P. 6) The next questions are about prescription-type drugs. There will be separate questions about sedatives, tranquilizers, stimulants and analgesics. As you can see from Page 6, sedatives include barbiturates, sleeping pills, and Seconal; sedatives are sometimes referred to as "downers". Tranquilizers include antianxiety drugs like Librium, Valium, Ativan (A-TI-VAN), and Meproamate (MEP-RO-BAM-ATE); tranquilizers are sometimes referred to as "nerve pills". Stimulants include amphetamines and Preludin (PRAY-LOOD-IN); stimulants are often called "uppers" or "speed". Analgesics include pain-killers like Darvon, Demerol, Percodan (PER-KO-DAN), and Tylenol with codeine. Now, please read the information below the line on Page 6 while I say it aloud. This is a very important point about the next set of questions. (PAUSE) We are interested in the nonmedical use of these prescription-type drugs. Nonmedical use is any use on your own; that is, either: One, without a doctor's prescription, or Two, in greater amounts than prescribed, or Three, more often than prescribed, or Four, for any reasons other than a doctor said you should take them--such as for kicks, to get high, to feel good, or curiosity about the pill's effect.

G1. (RB, P. 7) The first question is about sedatives, including barbiturates and sleeping pills. They are sometimes called "downers". People sometimes take barbiturates and other sedatives to help them go to sleep or to stay calm during the day. On Page 7 of your booklet is a list of commonly used sedatives to help you remember if you might have used anything like this. Have you ever used a sedative on your own, or nonmedically (that is, either without a doctor's prescription or in greater amounts or more often than prescribed or for a reason other than a doctor said you should use them)? INCLUDE "NONMED" REASON CLAUSE IN G1a-G1e

V1825

g2:tranquilzr on yourown REF=1825 ID=DDE

G2. (RB, P. 8) Turn to Page 8. This is a list of commonly used tranquilizers. People sometimes take tranquilizers to help calm down or to relax their muscles or to relieve depression. They are sometimes called "nerve pills". Have you ever used a tranquilizer on your own, or nonmedically (that is, either without a doctor's prescription or in greater amounts or more often than prescribed or for a reason other than a doctor said you should use them)?

V1833	g3:stimulant on your own REF=1833 ID=DDE
-------	--

G3. (RB, P. 9) Turn to Page 9. This is a list of commonly used amphetamines and other stimulants. People sometimes take stimulants to help them lose weight, stay awake, or to raise their spirits. They are sometimes called "uppers" or "speed". Have you ever used a stimulant on your own, or nonmedically (that is, either without a doctor's prescription or in greater amounts or more often than prescribed or for a reason other than a doctor said you should use them)?

SECTION R: SELF-DESCRIPTION-PART II

V5101

R0:R READS & MARKS ALONE REF=5101 ID=DDE

R0. (RB, P. 28-29) On Pages 28 and 29 of your Yellow Booklet, there are four lists of words people use to describe themselves. Indicate how well each word or phrase describes the way you generally are by circling the appropriate answer category. For example, the first word is "outgoing". If you see yourself as very outgoing, circle "VE" in the first column. If you see yourself as somewhat or a little outgoing, circle "SW" in the second or "LI" in the third column. If you are not at all outgoing, circle "NA" in the last column. Please work quickly. The best answer is usually the one that comes to your mind first. Let me know when you finish. (If you prefer, I can read the items to you.)
